

WHAT IS CLAIMED IS:

1. A plug for speaker cables, comprising:

a plug main body involving terminal loading slots for positive and negative polarities on the front thereof, loading slots for cables in response to said both polarities in the rear thereof, and a hollow inside thereof;

tongues for holding terminals functioning to hold speaker terminals inserted from said terminal loading slots from the external surface thereof by spring action;

tongues for holding cables coupled to said tongues for holding terminals and functioning to hold stranded wires of speaker cables inserted from said cable loading slots from the external surface thereof by spring action; and

said tongues for holding cables being operated so as to expand sections for holding cables by operating pieces disposed so as to be exposed outside said plug main body, respectively.

2. A plug for speaker cables according to claim 1 wherein an engaging lever is disposed on an external surface of a side on which terminal loading slots are provided, and said engaging lever is inserted into a plug loading slot while bending elastically to be engaged when said plug is inserted into said plug loading slot provided with output terminals or input terminals for loud speakers disposed on an amplifier or the like.

3. A plug for speaker cables according to claim 1 or claim 2 wherein a right sectional shape of said plug for speaker cables is formed into vertically or horizontally asymmetrical contour, and a front shape of a plug loading slot in an amplifier or the

like into which said plug is to be inserted is formed with an inside shape having the same section as that of an outside shape in the right section of said plug.

4. A speaker terminal, comprising:

one or more plug loading slot having such a mode that the front end of which opens into a substantially same sectional shape as a right sectional contour of a plug for speaker cables to be inserted to define the right sectional shape of an opening;

an engaging projection for latching and supporting an engaging portion of an engaging lever of a plug to be inserted and that is disposed at the front end of an opening edge in said respective plug loading slots; and

contact pieces in terminals of positive and negative poles for speakers being disposed on the inmost recessed wall surface of said plug loading slots so as to be horizontal with respect to the front end of said opening.

5. A speaker terminal according to claim 4 wherein extreme ends of contact pieces in terminals of positive and negative poles are disposed with a difference in their distances from the front end of the opening in said plug loading slots.

6. A speaker terminal according to claim 4 wherein said respective plug loading slots for right and left channels are disposed such that both the plug loading slots are in symmetrical disposition.

7. A speaker terminal according to claim 4 wherein front external surfaces of said plug loading slots for respective channels are colored separately.

8. A speaker terminal according to claim 4 wherein each shield plate is disposed in the front surface thereof except for each of said plug loading slots.

9. A speaker terminal system comprising:

a plug for speaker cables including:

a plug main body involving terminal loading slots for positive and negative polarities on the front thereof, loading slots for cables in response to said both polarities in the rear thereof, and a hollow inside thereof;

tongues for holding terminals functioning to hold speaker terminals inserted from said terminal loading slots from the external surface thereof by spring action;

tongues for holding cables coupled to said tongues for holding terminals and functioning to hold stranded wires of speaker cables inserted from said cable loading slots from the external surface thereof by spring action; and

said tongues for holding cables being operated so as to expand sections for holding cables by operating pieces disposed so as to be exposed outside said plug main body, respectively; and

a speaker terminal including:

one or more plug loading slot having such a mode that the front end of which opens into a substantially same sectional shape as a right sectional contour of a plug for speaker cables to be inserted to define the right sectional shape of an opening;

an engaging projection for latching and supporting

an engaging portion of an engaging lever of a plug to be inserted and that is disposed at the front end of an opening edge in said respective plug loading slots; and

contact pieces in terminals of positive and negative poles for speakers being disposed on the inmost recessed wall surface of said plug loading slots so as to be horizontal with respect to the front end of said opening.
